1. INTRODUCTION

A good introduction to fractal geometry is Falconer [1]. There is `smallmatrix` environment (e.g, $\left(\begin{smallmatrix} a & b \\ c & d \end{smallmatrix}\right)$). It is recommended to use $\ldots, \cdots, \cdots, \cdots, \ldots$ instead of $\ldots$ and $\cdots$. Then we test the `\nobreakdash`: p-adic, page 1–9, n-dim, 1-dim, σ-algebra. What about a text-mode fractional: $\frac{\log_k H}{1212}$.

Then for the `\xleftarrow`:

$$A \xleftarrow{n+\mu-1} B \xrightarrow[T]{n\pm i-1\text{bla, bla, bla}} C \underset{i\geq1}{\cap} A_i \bigcup_{k=1}^{100} \Upsilon_k \tag{1.1}$$

$$\Leftrightarrow$$

Compare the `\choose` and `\binom` : $\binom{n}{k}\binom{n}{k}$. $|z|, \|v\|, \|v\|_\infty$.

About the user-defined math operators:

$$\mathrm{ex}(\mathrm{conv}(A_i)) \operatorname*{abc}_{x\to0} \operatorname*{Lim}_{n\to\infty}$$

Then the `mod`: $\gcd(n, m \bmod n); \quad x \equiv y \pmod{b}, x \equiv y \mod c, x \equiv y \ (d)$.

See the following default math environments:

$$\vec{F} = m\vec{a} \tag{1.2}$$

$$\vec{F} = G\frac{m_1 m_2}{r^2}$$

$$\nabla \cdot \vec{E} = \varepsilon_0 \rho \tag{1.3a}$$

$$\nabla \cdot \vec{B} = 0 \tag{1.3b}$$

$$\nabla \times \vec{E} = -\frac{\partial \vec{B}}{\partial t} \tag{1.3c}$$

$$\nabla \times \vec{B} = \mu_0 \varepsilon_0 \vec{J} + \frac{\partial \vec{E}}{\partial t} \tag{1.3d}$$

$$E = \gamma m c^2$$
$$\mathcal{R}_{\mu\nu} - \frac{\mathcal{R}}{2} g_{\mu\nu} + \Lambda g_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu} \tag{1.4}$$

- \substack{} and \begin{subarray}

$$\operatorname*{Lim}_{\substack{0 \le i \le m \\ 0 < j < n}} P(i, j) \tag{1.5}$$

$$\sum_{\substack{i \in \Lambda \\ 0 < j < n}} P(i, j) \tag{1.6}$$

♡ \sideset{text}{right}{symbol}

$$a_0 + \cfrac{1}{a_1 + \cfrac{1}{a_2 + \cfrac{1}{a_3 + \cdots}}}$$

$$\prescript{*}{*}{\prod}_{n=1}^{\infty}{}^{*} \left[\prescript{*}{*}{\prod}_{*n=1}^{*\infty} \sum_{\text{ex}}^{} \prod_{\lim_{n\to\infty}}^{\infty} \Pi_{n=1}^{\infty} \right] \Bigg\} \lim_{n\to\infty} \text{Quantum Computing} \tag{1.7}$$

The \mathbf command is commonly used to obtain bold Latin letters in math, but for most other kinds of math symbols it has no effect.

\mid and \mathbin{} : $P(A \mid B) P(A \mid B) P(A|B)$

(a) f : X\to Y vs. f\colon X\to Y: $f : X \to Y$ vs. $f \colon X \to Y$.
(b) := vs. \colonequals : $:=$ vs. $:=$.
(c) $\{z : z \in \mathbb{Z}\}$ vs. $\{z \colon z \in \mathbb{Z}\}$.
(d) $v_1, v_2, \ldots, v_n$ vs. $v_1, \ldots, v_n$.

(e) $f(n) = O(n)$ vs. $f(n)$ is $O(n)$ or $f(n) \in O(n)$.

(f) $A \setminus B$ vs. $A \backslash B$ vs. $A - B$.

(g) There is a `\,` spacing between integrand and measure

$$\int_a^b x^2 \, dx$$

Here is some practical suggestions for mathematical writting.

(1) The structures for conditional sentences: `If ...`, `then...`; `When...`, `...`; `For ...`, `....` No `Let....` `Then...`!

(2) Avoid using `as` and `for` to introduce reasons after some conclusion.

(3) `Hence`, `Thus`, and `Therefore`, .

(4) `, so` is informal and should be used when the conclusion is short.

(5) A statement that is `assumed` is an axiom, and throughout to be true. Something `supposed` is a hypothesis and more appropriate to introduce a case or an argument by contradition. For example, `Suppose to the contrary that` and `Toward a contradiction, suppose that`.

(6) No v's or a_i's.

(7) No *nested* proof environments.

(8) `We induct on n` vs. `We use induction on n`.

(9) Prefer `pairwise` to `mutually`.

(10) No contractions like `can't`, `won't`, etc.

2. Commutative diagrams

Arrows `@>>>` `@<<<` `@VVV` `@AAA`. Double lines: `@=`. Null arrows: `@`

(2.1)
$$
\begin{array}{ccc}
S^{\mathcal{W}_\Lambda \otimes T} & \xrightarrow{\ j\ } & T \\
\| & & \downarrow{\scriptstyle \mathrm{End}\,P} \\
(S \otimes T)/I & =\!\!=\!\!= & (Z \otimes T)/J
\end{array}
$$

`tikzcd` is the ultimate answer to a commutative diagram in TeX.

$$
\begin{array}{ccc}
A & \xrightarrow{\ \phi\ } & B \\
 & & \downarrow \\
 & & C
\end{array}
$$
